Windows XP™

## DeckLink SP™

Analog video and audio capture and playback card with SD-SDI 4:2:2 monitoring

When you don't have genlock, you can output stable black so DeckLink SP locks the deck. This output is always stable and allows the deck to be set to input reference or auto reference. Be sure to set the "Black Video Output to Deck in Capture" option to "On Analog Outputs" in the DeckLink control panel, when using this feature."
